

We know what matters to people

Senior Frontend Developer (f/m)

Full time

advigo GmbH is the international market leader in life coaching. Based in Berlin, the group's portfolio includes digital counselling platforms, content and e-commerce services, websites and apps, as well as its own TV channel. With around 250 employees across various business units in Europe, the UK, Asia and Latin America, advigo offers support in life coaching, spirituality, astrology and esotericism.

Your challenge

Help us **design** a lean and easy-to-use architecture **from scratch** for one of Europe's largest marketplaces.

Replace with us and your Team **a legacy system iteratively** with a new lean modern software. Use the given freedom efficiently and choose from current platforms, services and technologies. Be a Shaper.

For the change, we rely on the latest technologies such as **React.js/Redux, Draft.js and Material Design**. In the backend, we use Java 8 with Spring-Boot and MongoDB Enterprise. We run the whole thing dockered in a kubernetes cluster.

Our offer

Our developers get the **free room** to work independently on product development and to actively contribute to tech decisions.

The training and development path of our employees is essential to us. We empower employees to participate in various **training activities** (seminar, conferences, certifications etc.)

We always provide you with the **latest technical equipment** and best working conditions.

If you want to work on a **challenging project** and benefit from personal growth opportunities within an established company, then advigo is the right place for you!

Your profile

You have several years of experience with **Javascript** as one of the most popular programming languages on Github. We understand that you are familiar with the syntax, rules and structures as well as conventions and community standards.

You are **not dependent on libraries**, but you know when, where and why to use them. Microservices and the use of REST API's or GraphQL are also familiar to you.

You know how to **write unit tests** and debug your code with modern developer tools. **Quality** is generally not negotiable for you and you like to work in an interdisciplinary, agile team.
